

6 Reasons to Upgrade to Synchronous ERP

1 Drive Cost Reductions

The number one reason most organizations choose to implement an ERP system is to integrate business processes to simplify operations and allow for faster decision making. Synchronous ERP automatically captures all relevant information pertaining to common tasks such as purchasing, manufacturing, or shipping inventory. This means that accurate inventory information is maintained without additional effort. Historical trends of inventory consumption can also be used to predict future demand, enable lean processes and reduce the costs associated with managing inventory.

Intuitive interfaces in Synchronous provide the accurate data necessary for effective decisions throughout the enterprise. This access to real-time information allows for the improvement of process efficiencies resulting in overall cost reductions. The software allows many time-consuming processes in the warehouse or manufacturing plant to be automated, through the use of bar-coding and mobile scanners. Synchronous also promotes intelligent planning, making optimal use of staff and equipment, while minimizing wasteful travel and downtime.

*Best-in-Class midmarket organizations have seen a direct reduction of **25%** in operational costs as a result of their ERP implementation.*

2 Manage Change and Mitigate Risk

All organizations must respond to constant change, both within their operations and in the broader marketplace. Internally-driven changes include events such as bringing on a new customer or adding a product line, which a business typically has some level of control over. External changes (e.g. tax reforms or new technologies) generally cannot be controlled or ignored.

An ERP system should support a business as it adapts to both internally and externally-driven change. Synchronous is a full-featured, complete ERP system with advanced modules that can be enabled at no additional cost as your business expands in scale and complexity. Synchronous ERP is also a managed system that includes professional support. This means that our software is constantly up to date with changes in the marketplace, and we can provide technical and business consulting services to guide our clients through these changes.

Midsized organizations that add collaboration technologies to ERP and BI saw 25% improvement in time-to-decision

3 Secure Your Business

The business data that an ERP system collects can be as valuable to criminals as it is to your own operations and this data is under constant attack by external forces. Luckily, Synchronous ERP protects your data with multiple levels of security and encryption. The use of industry leading security combined with our proprietary technology ensures your data is safe at all times.

Additionally, Synchronous ERP has a comprehensive system for managing rights and permissions for users. Completely tailor the user experience to simplify their world, while also protecting overall data integrity. This means that members of your organization have access only to the information that is appropriate for their role.

Don't fall into the trap: Nearly half of IoT security will be spent on Remediation by 2022

4 Optimize Planning and Budgeting

The ability to make accurate and timely decisions depends on having a complete, unified repository of current data from all aspects of your business.

Synchronous ERP integrates all business operations and ensures that information is entered in a rigorous and consistent manner. Schedules and tasks for all employees can also be maintained centrally, guaranteeing all team members have clear goals and access to the information they require to carry out their objectives.

This body of knowledge can be analyzed with a variety of powerful tools for reporting and business intelligence, allowing authorized users to answer any question they may have about the operations of the business. Synchronous ERP includes a wide range of preconfigured reports, a customizable report writer, and integrates with Microsoft Excel and Power BI for dashboards and ad-hoc reporting.

Synchronous replication migrates the entire product from the cloud in a hosted system to your own server and/or alternative locations and back again.

Maintaining up-to-date data ensures continuity, fault tolerance, and peace of mind.

Synchronous ERP can be run “in the cloud” (on servers that we manage in our secure data centres), or it is possible to maintain your own server internally. An on-premises server can be useful in areas with poor internet connections where cloud computing is not yet viable, and also permits our software users to keep a constantly updated copy of their data firmly in their own possession.

15% of CIOs *never expect to recoup ERP costs*

22% *think that doing so will take longer than 4 years.*

5 Protecting Data integrity

In the event of a natural disaster or hardware failure, will your data be available? With Synchronous ERP, secure backups are made continuously to multiple locations equipped with redundant power supplies and Internet connectivity. This redundancy means that a current copy of your data is always held in a secure location, ready to keep your operations running after a disaster or computing failure. These backups are regularly tested by Synchronous to ensure they are ready at a moments notice.

6 Profit From Our Specialized Resources

In order to realize the benefits of an ERP system, it is important for your staff to receive in-depth training and support. Our staff can provide expertise to answer your team's questions on issues related to accounting, technology, or business analysis.

Support services are included in the price of our software because we believe that this encourages users to make effective use of our product. Should you choose to run Synchronous ERP in the cloud, our staff can manage all aspects of your system remotely, reducing the complexity of your Information Technology infrastructure. Our managed approach will help your organization get the most out of your ERP system. As your business matures, so will its needs. Synchronous consultants will ensure that while you evolve, so does your use of the system.

*Only **39%** of business leaders utilize ongoing support during implementation*

According to Gartner nearly half of businesses (48%) admit they find the range of ERP solutions confusing.

About Synchronous ERP

Synchronous empowers companies throughout North America to seamlessly create and deliver quality products or services to every one of their customers. This value model ensures every party receives an outstanding experience. Enterprise class functionality should be applied to businesses of any size and Synchronous is a dedicated long-term partner your company can depend on.

An ERP system should support a business as it adapts to both internally and externally-driven change.
